## Week 2 Overview

---

This week was about learning the basic building blocks of UI design and turning them into reusable components in Figma. Instead of designing full pages, the focus was on breaking the interface down into smaller pieces — buttons, cards, input fields, navigation, and so on — and making sure they all look and behave consistently.

This is a continuation of the LUNA project from Week 1. LUNA is a women's fashion clothing brand, so the whole component library follows the same visual direction that was already set for the site — clean, modern, feminine, and simple. I didn't start a new style from scratch, I just used what was already decided and applied it to smaller UI pieces.

By the end of the week, all the components were arranged together in one Figma frame called "UI Components Library", which is what this documentation is based on.

## Learning & Practice

---

Here's what I actually picked up while building the component library, not just the theory behind it:

- I learned that a UI component isn't just something that looks nice on its own — it needs to match the spacing, colors, and typography of everything else so the whole interface feels like one system, not separate pieces stuck together.
- Buttons aren't just one static shape. I had to think about primary, secondary, text-only, and icon-only buttons, plus how each one changes across different states.
- Cards are basically reusable containers — I used the same card structure for a product, a category, and a promotional banner, just changing the content inside.
- Forms and input fields need more attention than I expected — a text field alone isn't enough, it also needs a filled state, a focused state, an error state, and a disabled state so the user always knows what's happening.
- Navigation elements like nav links, tabs, breadcrumbs, and pagination all need clear states too, so the user can tell what's active, what's hovered, and where they currently are on the site.
- Icons work best when they're kept simple and consistent in style and size, since they're used across so many different components.
- Typography and color only really "make sense" once you see them applied across multiple components — that's when you notice if something feels off.
- Alignment and spacing take more patience than actual design decisions. A lot of the time went into just double-checking that things lined up properly.

Overall, the main lesson was consistency — making sure every component feels like it belongs to the same design system, not like it was designed separately.

## LUNA Visual Direction

---

The UI kit follows the same visual identity that was set up for LUNA in Week 1. Nothing new was introduced here — the colors, type styles, and overall mood were just reused and applied to the smaller components.

## Color Palette

# COLOR PALETTE

## PRIMARY COLORS

## SEMANTIC COLORS

The palette is built around soft neutral tones — cream, white, black, and warm greys — with a terracotta / brown shade used as the main accent color. A few lighter beige and blush tones are used as supporting colors.

On top of that there are two semantic colors: a red tone for error states and a green tone for success states. I haven't attached exact hex codes here since they weren't pulled from the file — the palette was chosen to keep LUNA's identity consistent, and the colors are visible directly in the swatch image above.

## Typography

# TYPOGRAPHY

|                  |         |          |
|------------------|---------|----------|
| DM Serif Display | Display | Regular  |
| DM Serif Display | H1      | Regular  |
| DM Serif Display | H2      | Regular  |
| DM Serif Display | H3      | Regular  |
| Manrope          | Body    | Regular  |
| Manrope          | Small   | Regular  |
| Manrope          | Caption | Medium   |
| Manrope          | Button  | Semibold |

Two typefaces are used across the kit. DM Serif Display is used for the bigger, more expressive text — Display, H1, H2, and H3 — which gives the fashion-brand feel to headings. Manrope is used for everything functional — body text, small text, captions, and button labels — since it's cleaner and easier to read at smaller sizes. Keeping just these two fonts across every component is what ties the whole kit together.

# UI Components Created

Below are the components that are actually part of the final LUNA UI kit, along with what each one is for.

## Navigation

The navigation bar has the LUNA logo, a menu icon, the main nav links (Home, New Arrivals, Collections, Dresses, Sale), and icons for search, wishlist, and cart on the right. Underneath the main bar, I also worked out how each nav link looks in its default state, its hover state, and its active/current-page state (shown underlined), so the navigation gives clear feedback no matter where the user is on the site.

## Buttons

Four button types were created: primary, secondary, text-only, and icon-only, plus a toggle switch. Each button type has multiple states stacked below it, showing how it looks by default and how it changes when it's hovered, active, or disabled. The primary button uses a solid dark fill, the secondary button is outlined, and the text button is just the label without a container — all of them use the same label style so they read as part of one family.

## Icon Buttons

A separate set of icon-only buttons was made for actions like wishlist (heart), menu/list, search, bag, close, add, remove, and confirm. These are shown across default, hover, active, and disabled states. Two extra variations are included separately — a confirmed/selected icon and an error icon (in red) — for places where the interface needs to show a quick success or error response.

## ICON BUTTONS

### Cards

Three types of cards were built using the same base structure:

- A product card, with an image, a wishlist icon, the product name ("Linen Midi Dress"), category, price, and a small add-to-bag icon.
- A category card, with an image and an overlay label ("DRESSES") plus a link to explore the collection.
- A promotional banner card, with a "NEW COLLECTION" tag, a short heading, and a "Shop Collection" button.

All three share the same card shape, corner style, and spacing, even though the content inside changes.

## CARDS

A product card for a 'Linen Midi Dress'. The top half features a photograph of a woman in a light blue, button-down, midi-length dress with a side slit, holding a small green handbag. A heart icon in a circle is in the top right corner of the image. Below the image, the text 'Linen Midi Dress' is displayed, followed by 'Dresses' in a smaller font, and 'Rs. 4,990' in a bold font. A shopping bag icon is located in the bottom right corner of the card.

Linen Midi Dress

Dresses

Rs. 4,990

NEW COLLECTION

**Effortless pieces for every day.**

Shop Collection

## Input Fields

This section covers a regular input field, a search field, a dropdown/select field, and a checkbox. Each one has several states — a default/placeholder look, a filled state with real content, a focused state, an error state (with a small warning message under the input field), and a disabled/greyed-out state. The checkbox shows unchecked, checked, and disabled versions.

## Tabs

A simple tab/filter component was made for category filtering — All, Dresses, Tops, Bottoms, Accessories — shown in its default state and its active state, where the selected tab is underlined.

## Breadcrumbs

A breadcrumb component was added to show the user's location within the site, going from a simple "Home /" up to a full path like "Home / Collection / Dresses", with the current page shown in bold.

## Pagination

A pagination component was created for pages with multiple product listings, with numbered pages, previous/next arrows, and a highlighted state to show which page is currently active.

## States and Variants

---

One of the bigger parts of this week was not just designing components, but designing their different states. The states I actually created across the kit are:

- Default — how the component looks normally.
- Hover — a slight change when the user's cursor is over it.
- Active / Selected — used on buttons, tabs, nav links, and pagination to show the current choice or page.
- Filled — used on input fields, search fields, and dropdowns once they have content in them.
- Error — a red-bordered state on input fields with a short warning message.
- Disabled — a greyed-out, lower-opacity state used across buttons, icon buttons, input fields, and checkboxes.

Designing these states matters because they give the user feedback — they can tell what's clickable, what they've already selected, and what's not available, without needing to guess. It also keeps that feedback consistent across the whole website instead of every button or field behaving differently.

## Alignment and Spacing

---

While building the components, I also paid attention to how everything lined up next to each other — buttons, icons, input fields, and card content are all aligned so nothing feels off-balance. I kept spacing and padding consistent across similar components (for example, all the button variants use the same internal padding, and all the input fields use the same height and label spacing), and I used the same corner rounding across buttons, cards, and input fields so they visually belong to the same set.

I haven't documented an exact spacing scale (like a strict 4px/8px grid) for this file — the priority this week was keeping things visually consistent by eye across every component, rather than locking in exact spacing values.

## Final UI Components Library

All of the components above were brought together into one final Figma frame called "UI Components Library", organized into sections for colors, typography, buttons, icon buttons, input fields, navigation, tabs, breadcrumbs, pagination, and cards.

The point of putting everything in one place wasn't just to have a nice-looking sheet — it's so that when I (or anyone else) design a new page for LUNA later, these components can just be reused instead of rebuilt from scratch. It also makes it a lot easier to keep new screens visually consistent with what's already been designed.

## What I Learned

- The difference between a one-off UI element and a proper reusable component — a component needs to work correctly across different states, not just look right once.
- How to think through and design multiple states (default, hover, active, error, disabled) instead of only designing the "happy path" version of a component.
- Why consistency in spacing, corner radius, and sizing matters more than I expected — small mismatches are easy to miss until everything is placed side by side.
- How typography and color choices actually read once they're applied across many small components, not just on a big hero section.
- How to organize a Figma file so components are grouped logically and easy to find later.

- A basic understanding of what a "component library" or design system actually is, and why teams use one instead of designing every screen from zero.

## Final Outcome

---

By the end of Week 2, I had a working set of reusable UI components for the LUNA fashion website — covering navigation, buttons, cards, input fields, tabs, breadcrumbs, pagination, icons, colors, and typography. It's not a complete design system, but it gives me a consistent base to build new LUNA screens from going forward, instead of starting each one from scratch.
